Protect Your Investment With SiloSolve® AS

Most farmers experience heating of silage largely due to growth of yeast and mold. Good management, including proper compaction, reduces the heat. However, some crops, such as corn, heat more often than other crops. Yeasts & molds are fungi that grow well in the presence of oxygen. Yeasts initiate the heating of silage and molds and molds usually follow. Certain molds produce harmful mycotoxins. Mycotoxins may compromise production and health of animals.

BENEFITS

- Reduced heating and dry matter loss.
- Improved silage stability.
- Reduced growth of yeast and mold.
- Improved silage quality.

FEATURES

- Fast starter, strong finisher.
Novel *L. buchneri* strain.

STRAINS/CONTENTS

- *Enterococcus faecium* M74
- *Lactobacillus plantarum* CH6072
- *Lactobacillus buchneri* LB1819

DOSE

- 150,000 cfu/g forage

APPLICATION RATE

- 2g / treated ton

PACKAGING

- 200 g canister (100 tt)
- 1000 g canister (500 tt)

USES

- Ideal for a range of crops, especially at lower DM (higher moisture) prone to heating a feedout due to yeasts and mold.

CROPS

- Haylage, Corn Silage, HMSC/HMEC, Earlage, Snaplage.
