

**CHICORY**  
Better Genetics.  
Better Productivity.  
Better Profitability.

**ENDURE**

## **PERSISTANCE EVEN IN WET SOILS**

Bred to withstand wetter soils, Endure excels where other chicory varieties fail. Endure is a very high yielding variety that produces tons of high-quality forage. Drought tolerant with superb summer production Endure can help your grazing needs all summer long. Endure provides a high protein diet for livestock and wildlife. Chicory is also shown to control internal parasites in sheep.

### **AGRONOMIC RECOMMENDATIONS**

Chicory prefers well to moderately drained soil of medium to high fertility.

Chicory establishes best on a moist firm seedbed.

Planting depth no deeper than ¼ inch.

Seeding 5-6lbs per acre

Soil pH should be at least 5.5.

Nitrogen fertilizer should be applied at planting at a rate of 35lbs per acre. Subsequent nitrogen applications (30-50 lbs/acre) can be made after each grazing in the spring and fall up to 200 lbs/acre/year.

### **GRAZING RECOMMENDATIONS**

Do not grazed until the chicory is at least 8 inches tall. (generally occur 60 to 80 days after seeding)

Graze no lower than 3 inches.

Chicory should be allowed to accumulate growth of 4-6 inches before going dormant in the fall.

A rest period of 14 to 25 days between grazing periods is best for chicory persistence and performance.

Caution should be taken to not over graze in August as chicory growth slows in August during periods of high temperatures.
